

HHL algorithm: quantum algorithm for linear systems of equations

Purpose: solve $\vec{A}\vec{x} = \vec{b}$ using a quantum computer

The procedure for HHL algorithm

$$A \rightarrow U = e^{iAt}$$

Step 1.

Transfer a Hermitian matrix A into a unitary operator e^{iAt} .

PS. If A is not a Hermitian matrix, define $C = \begin{pmatrix} 0 & A \\ A^H & 0 \end{pmatrix}$. Then C is

Hermitian matrix, and we can solve $C\vec{y} = \begin{pmatrix} \vec{b} \\ 0 \end{pmatrix}$ to obtain $\vec{y} = \begin{pmatrix} 0 \\ \vec{x} \end{pmatrix}$.

$$|b\rangle = \sum_{i=1}^N b_i |i\rangle$$

Step 2.

Prepare the input $|b\rangle = \sum_{i=1}^N b_i |i\rangle$.

PS: $\vec{b} = (b_1, b_2, \dots, b_N)$ and $\sum_{i=1}^N |b_i|^2 = 1$.

The procedure for HHL algorithm

Step 3.

Decompose $|b\rangle = \sum_{j=1}^N \beta_j |u_j\rangle$ in the eigenvector basis, using phase estimation.

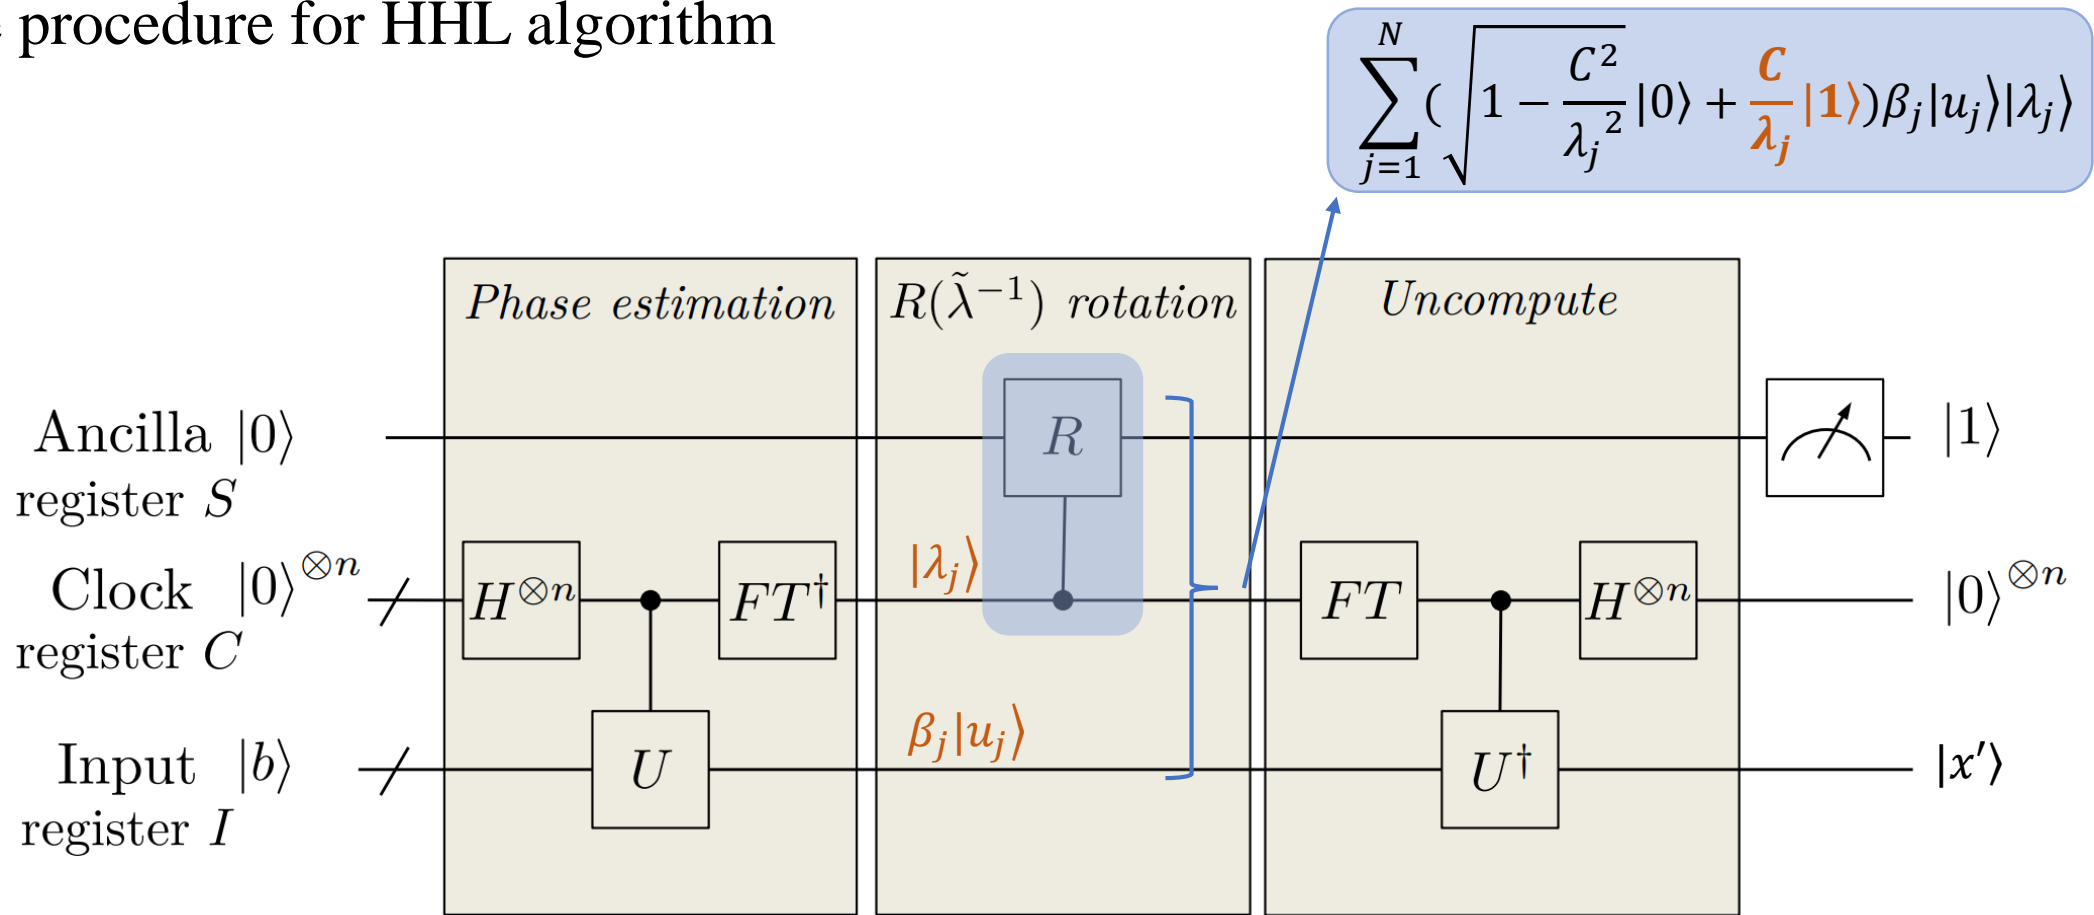

PS: 1. $|u_j\rangle$ is the eigenvalue of A , and $|\lambda_j\rangle$ is the eigen vector of A .

2. The result in blue rectangle is obtained for the ideal situation, when we consider the phase estimation as an accurate process. For more information, please check the paper.

3. To make the graph simple, I use $|\lambda_j\rangle$ and $\beta_j |u_j\rangle$ to denote the clock and input registers after phase estimation (PE). However, they are actually in entanglement after PE, and both of them are in the superposition of a series of quantum bases, as is shown in the blue rectangle.

The procedure for HHL algorithm

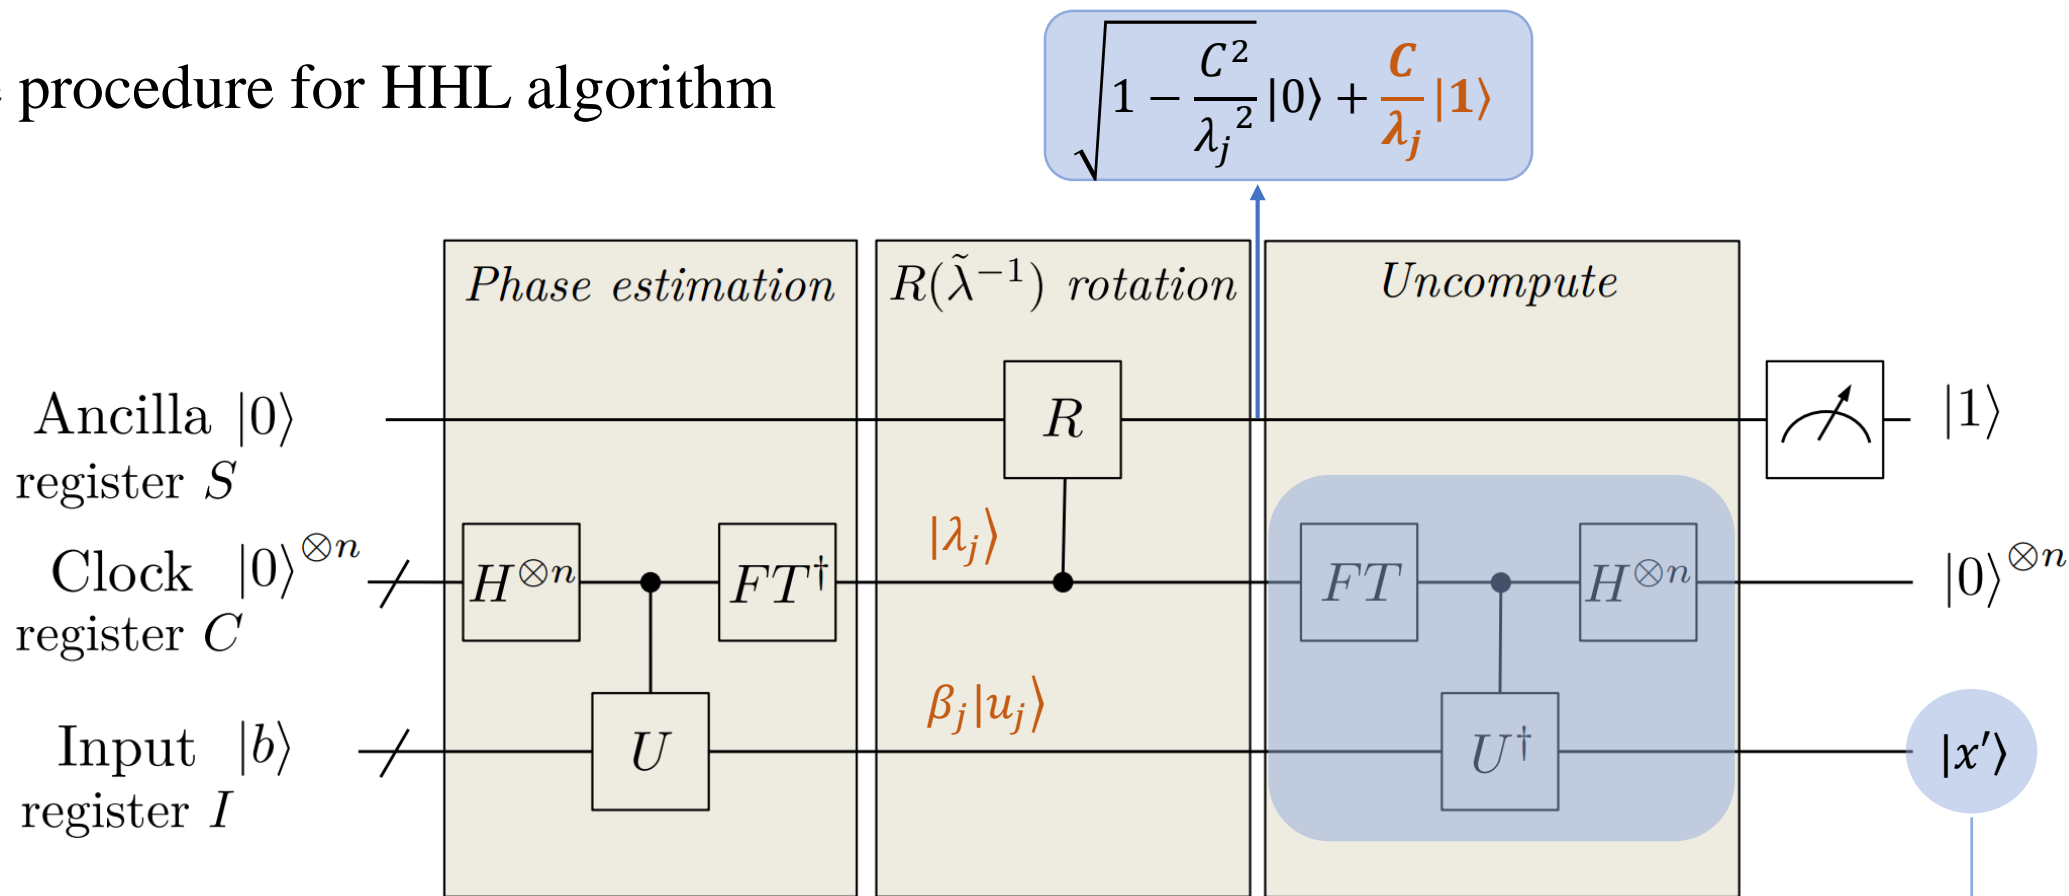

Step 4.

We use the clock register as a control qubit to rotate the ancilla qubit. The ancilla qubit register becomes the superposition of state 0 and 1.

PS: $C = O(1/\kappa) \leq \min_j |\lambda_j|$

The procedure for HHL algorithm

Step 5.

Use inverse phase estimation to uncompute $|\lambda_j\rangle$ ($|\lambda_j\rangle \rightarrow |0\rangle$). Measure the ancilla register, if the result of measurement is $|1\rangle$, we can get $|x\rangle$. If the result is $|0\rangle$, we need to recalculate.

PS: $N_{x'} = \sum_{j=1}^N (\frac{C}{\lambda_j} \beta_j)$

Our goal: $|x\rangle = \sum_{j=1}^N \lambda_j^{-1} \beta_j |u_j\rangle$

$$|x'\rangle = \frac{1}{\sqrt{N_{x'}}} \sum_{j=1}^N \frac{C}{\lambda_j} \beta_j |u_j\rangle \propto |x\rangle$$
