

# 1 Introduction to the references

## 1.1 Quantum Computing

[1] **Quantum computation and quantum information:** This is the classical textbook for learning quantum computing algorithms and quantum information technology (e.g. quantum Fourier transform, quantum phase estimation).

## 1.2 Quantum Machine Learning

[2] **Quantum machine learning:** A review paper on QML techniques and algorithm. List QML algorithms including Bayesian Inference, Online Perception, Least Square Fitting, Quantum BM, Quantum PCA, Quantum SVM and Quantum reinforcement learning, and whether they use HHL algorithm or not.

[3] **Machine learning & artificial intelligence in the quantum:** This is an extensive review paper with a strong focus on agent-based models.

[4] **Quantum machine learning: what quantum computing means to data mining:** A textbook introducing CML and QML algorithms. This is the first monograph on the subject that also covers more esoteric topics, for instance, what we call today quantum learning.

[5] **Supervised learning with quantum computers:** This is the most up-to-date book on QML.

[6] **Quantum machine learning for data scientists:** This is a review paper on the quantum computing, quantum algorithms that is usually used in QML, and QML algorithms.

## 1.3 Input data encoding

This subsection is about the techniques to transfer classical data to quantum data, which means to create superpositions with arbitrary weights.

[5] **Supervised learning with quantum computers:** This book includes the strategies of implementing the classical-quantum interface, which is to encode classical data into quantum data.

[7] **Creating superpositions that correspond to efficiently integrable probability distributions** Create the input quantum states for Grover's search, and this technique can also be used in some other quantum algorithms, such as HHL algorithm.

## 1.4 Papers for Specific Algorithms

### 1.4.1 HHL algorithm

[8] **Quantum algorithm for linear systems of equations:** This is the first paper to propose this algorithm.

[9] **Quantum circuit design for solving linear systems of equations:** An experimental implementation for the HHL algorithm, which introduces a quantum circuit for solving a  $4 \times 4$  linear system.

[10] **Quantum circuits for solving linear systems of equations:** An experimental implementation for the HHL algorithm, which introduces a quantum circuit for solving a  $2 \times 2$  linear system.

### 1.4.2 Quantum Support Vector Machine

[11] **Quantum optimization for training support vector machines:** This paper implement quantum Support Vector Machine (SVM) based on Grover's search algorithm, with quadratic speedup, compared with classical SVM. And it uses the classical datasets, Iris dataset and Breast cancer dataset.

[12] **Quantum support vector machine for big data classification:** This paper implement quantum SVM with exponential speedup.

## 1.5 Implementation and SDKs

[13] **Getting started with qiskit - qiskit terra 0.7.0 documentation:** The documentation webpage for Qiskit version 0.7.0, with the introduction of its packages, functions and examples for quantum gates.

[14] **Optimization of circuits for ibm's five-qubit quantum computers:** This paper is about how to optimize the quantum circuit when coding on IBM's quantum computer cloud service. It introduces quantum circuits to break the constraints of hardware limitations, and methods to reduce the number of gates in circuits.
